

EXPANDING SEALING FOAM - Designed to seal door and window frames

Key Benefits

- Long lasting
- Self adhesive for easy application
- Absorbs noise
- Draughtproof
- Water resistant
- Ideal for many other uses in the construction industry
- Available in a wide range of widths and thicknesses

Description

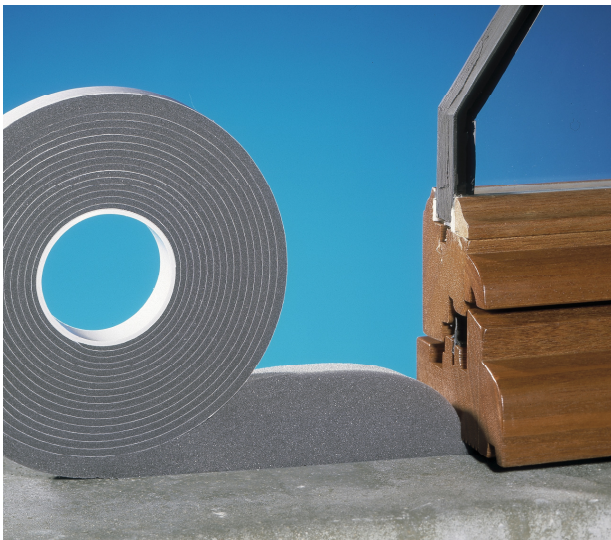

Expanding Sealing Foam is an extremely versatile self-adhesive acoustic foam tape that expands to completely fill gaps and voids. It is particularly useful applied around replacement window and door frames during installation.

Use to Seal Door and Window Frames

A polyurethane, cellular foam impregnated with flame retardant properties. The expanding foam tape is supplied with one side self-adhesive for initial positioning. It is available in a range of widths and thicknesses and so can be supplied to suit almost any gap sealing application.

The product is most useful when used to seal around door and window frames but can be used anywhere when a flexible, acoustic, waterproof and thermally efficient foam sealer is required.

This Expanding Sealing Foam is exactly what the name suggests. It is supplied compressed on a roll that slowly expands after it has been applied. This gives time for the frame to be installed before the foam totally expands effectively sealing the space between the frame and the wall.

Expanding Sealing Foam when used to seal window and door frames will efficiently fill the void that is often there and so will improve both the acoustic and thermal insulation of the frame and will not be affected by water. The expanding foam should be used along with the normal gun applied sealers to finish off the joint of the frame with the wall to give the usual neat finish.
